

During storage or transport, cardboard products should be stored according to the conditions mentioned below, otherwise any complaints will not be accepted:

1. Products should be stored in well-ventilated rooms with air temperature between 5-30°C and relative humidity between 30-70%. Sudden changes of temperature or humidity in storage rooms are prohibited.
2. Products cannot be stored directly on the floor. Use pallets or platforms with clean and dry surface.
3. Products should be protected against precipitation such as rain or snow and condensation inside a wrapped pallet. The possibility of splashing a pallet with the products with water or wet snow should be excluded during transport or when washing the floor around it.
4. Products should not be exposed to direct sunlight.
5. Products should be protected against dust and other contamination.
6. Products should be protected against sources of heat as well as sudden and frequent changes of climate conditions, e.g. opening doors frequently, direct flow of air from the ventilation or heating system.
7. Ensure and enable products for easy and proper relocation depending on the size of the batch according to the FIFO principle.
8. Products supplied to the warehouse should be kept in the same condition as they were supplied to the printing house without removing any safety elements until their use.
9. Avoid pallet stacking because this may cause damage to products stored on the lowest pallet.
10. When removing any safety elements from the pallet (belts, wrap), use any sharp tools, such as knives carefully so that the packaged product is not damaged.
11. Keep any identification documents of the pallet, e.g. tags and labels, until all products from a given pallet are used.
